

Mounting a zip slider on continuous zip tape

This method is worked from the wrong side of the zip.

1. Hold the zip tape wrong side up.
2. Pull gently on the zip tape to separate the two sides.
3. Pinch the zip slider by the zip puller between your thumb and forefinger, reverse side up, with the rounded end of the slider facing towards you.

4. Take one side of the zip tape, and angle slightly while feeding through the slider, until about 1/2cm is showing from the top of the slider. This side of the tape will run quite freely through the slider.

5. Swap the slider to the other hand, pinching the puller as before.
6. Again, angling the zip tape slightly, feed the tape into the slider. This time the tape will only feed half way into the slider. You may hear a click as the zip coil engages in the slider.

7. While keeping a firm grip on the zip puller, with the other hand, grasp the tapes across the top end of the slider between your thumb and forefinger, and gently pull the slider down the length of the zip.
